*Mazda Fuel Consumption and Emissions figures are based on ADR 81/02 test results under the NEDC test programme. This data is useful in comparing the fuel consumption of different vehicles, however it may not be the fuel consumption achieved in practice. This will depend on traffic and road conditions, accessories fitted and how the vehicle is driven.

Please note that from December 2021 the NZTA has standardised the reporting of all Fuel Consumption and Emissions data based on 3-Phase WLTP, using a formula to convert NEDC to 3P-WLTP. This data will appear on websites such as Rightcar and Fuelsaver.

The details and specifications described are subject to change without notice. Please consult your local Mazda dealer for exact information.

MAZDA BT-50

PAYLOAD AND TOWING CALCULATOR

STATEMENT OF PURPOSE

The Payload and Towing Calculator has been provided to promote safe operation of your Mazda BT-50. Its objective is to ensure the aspects of load capacity and weight distribution fall within safe limits. Please use this calculator as a general guide only.

Note: To reduce complexity with this tool, we have not included calculations for Front Axle Loading. For general use situations, Front Axle Capacity is not likely to be exceeded. However, for specific requirements or unique applications, please consult your Mazda Dealer.

GLOSSARY

Gross Combined Mass (GCM):

The maximum total combined weight of a vehicle including its cargo, occupants, accessories and any towed mass.

Trailer Mass:

The total weight of a trailer and its load, including the towball download.

Gross Vehicle Mass (GVM):

The maximum weight of a vehicle, including all accessories, body construction, occupants and cargo.

Kerb Weight:

The unladen weight of the vehicle, (less occupants, tray/body and accessories), including fuel.

Towball Download:

The downward load that is applied to the tow coupling when a trailer is attached (this load is part of the Trailer Mass).

Vehicle Accessories:

Any attachment/device that has been added to the vehicle after it was manufactured (e.g. tray, sports bar, canopy etc.).

Rear Axle Capacity:

The maximum total weight the rear axle can carry, including the unladen weight of the axle.

Provisional Payload:

This is the INTERIM calculated payload weight, without taking load distribution into account.

Permissible Payload:

This is the FINAL payload figure, with weight distribution (i.e. rear axle capacity) accounted for.

EQUALS:		k) 935kg	k) kg
		[k] = [g] - [j]	

INSTRUCTIONS

- To calculate PERMISSIBLE payload for your needs in column Ⓑ, use example in column Ⓐ as a guide.
- Please work through sections A–H in sequence.
- Model-specific weights and capacities data for elements f) and p) can be found on page 4.
- Provisional Payload is calculated by deducting fixed and variable weights from the Gross Combined Mass (GCM) or Gross Vehicle Mass (GVM) figures (where appropriate).
- Permissible (final) Payload is then confirmed once w Provisional Payload against the eight distribution is calculated, by checking the maximum Rear Axle Capacity.
- For specific requirements, please consult your Mazda Dealer.
